SIR0010001 created - Suspicious logon activity and privilege escalation...

Approval : Not Yet Requested

Description : Brute-force logon detected against svc-backup from 203.0.113.45 (9 failed attempts, then success). Same account subsequently logged on from an unusual external IP 185.220.101.7 and added j.smith to Domain Admins.

Impact : 1 - High

Opened by : System Administrator

Priority : 4 - Low

Short description : Suspicious logon activity and privilege escalation on svc-backup

State : Draft

System Administrator
| 11:58

Work notes : Investigation performed via KQL in Azure Data Explorer.

Query 1 - Brute force detection:

SecurityEvent

| where EventID in (4624, 4625)

| where Account == "svc-backup"

| order by TimeGenerated asc
Result: 9 failed logons (4625) followed by 1 successful logon (4624) from IP 203.0.113.45.

Query 2 - Anomalous source IP:
SecurityEvent
| where EventID == 4624
| summarize count() by IpAddress
| order by count_desc
Result: External IP 185.220.101.7 identified outside the normal internal range (10.10.1.x).

Query 3 - Privilege escalation:
SecurityEvent
| where EventID == 4728
| project TimeGenerated, Account, TargetAccount, MemberName, IpAddress
Result: svc-backup added j.smith to Domain Admins shortly after the suspicious external logon.

Verdict: True Positive. Full compromise-to-privilege-escalation chain confirmed.

Priority : 2 - High

System Administrator
| 12:01

Work notes : Recommendations:
- Rotate credentials for svc-backup immediately
- Remove j.smith from Domain Admins pending review
- Alert on any future EventID 4728 involving privileged groups
- Enforce MFA on service accounts

Image Uploaded :

The screenshot shows the Azure Data Explorer interface. The query executed is:

```
SecurityEvent
| where EventID == 4728
| project TimeGenerated, Account, TargetAccount, MemberName, IpAddress
```

The results are displayed in a table with the following columns: TimeGenerated, Account, TargetAccount, MemberName, and IpAddress. The data row shows:

TimeGenerated	Account	TargetAccount	MemberName	IpAddress
9/2/2026 3:45:00 AM	svc-backup	Domain Admins	j.smith	185.220.101.7

Below the table, the JSON representation of the result is shown:

```
[{"TimeGenerated": "2026-09-02T03:45:00.000Z", "Account": "svc-backup", "TargetAccount": "Domain Admins", "MemberName": "j.smith", "IpAddress": "185.220.101.7"}]
```

The screenshot shows the Azure Data Explorer interface. The query editor contains the following SQL query:

```
1 SecurityEvent
2 | where EventID == 4624
3 | summarize count() by IPAddress
4 | order by count_desc
```

The results table, titled 'Table 1', displays the following data:

IPAddress	count_
> 10.10.1.26	3
> 10.10.1.42	3
> 10.10.1.57	3
> 10.10.1.23	3
> 10.10.1.21	3
> 10.10.1.30	3
> 10.10.1.18	3
> 185.220.101.7	3
> 10.10.1.51	3
> 10.10.1.37	2
> 203.0.113.45	1
> 10.10.1.43	1

The JPath is set to /IpAddress, and the visualization is set to Full.

Work notes : Incident confirmed as True Positive: brute-force compromise of svc-backup leading to unauthorized privilege escalation (j.smith added to Domain Admins). Investigated via KQL in Azure Data Explorer. Recommended remediation: rotate svc-backup credentials, remove j.smith from Domain Admins, enforce MFA on service accounts, alert on future EventID 4728 involving privileged groups. Incident resolved.

State : Closed
